WDD Final Project Write-up

1. Pop-out navigation menu sidebar

   a. This feature is significant as it is interactive and guides the user through all the pages of the website. By default, the nav sidebar is not visible unless the user clicks on the menu button which is the three lines that also darken once the user's mouse hovers over the button. When the menu sidebar slides out, the user will see the three pages along with the homepage link. All four links darken and are underlined when the user's mouse hovers over the link. The menu is also designed minimalistically in order not to draw the user's attention away from the main content of each page.

2. Image carousel

   a. The image carousel's purpose is to showcase the photos I have taken in an easy to view and compact way. I used two separate image carousels in order to divide the photos into landscape and portrait orientations. The images in each carousel also have a sliding transition so that the jump from one photo to the next is not too abrupt, reflecting a similar design feature as the navigation menu bar sliding out.

3. Contact form

   a. The form has four text boxes for the user to enter their respective information in. The last text box for the actual message is wider across the screen because intuitively, there will be more text in that box than the other three boxes. Pressing the submit button will prompt a web alert to pop up and inform the user that their inputted information has been saved and processed. After pressing 'ok' on the pop up, the page will refresh to an empty contact form again.
